All good points Jannine. Including a process diagram with the early dates and activities, where we are now and what's going on at each OU, and what we expect in the future (near and far) will help to show the 15+ years of work. That way the PDFs you showed us will be used for reference and images, but neither lifted verbatim.

Thanks!
k

Kay/Julie

In reviewing these, I do like the visuals provided in the 2 figures in the first diagram. They clearly illustrate the pieces of information that will be considered and the decision that EPA will make. I also like the section that immediately follows that states what is looked at if the remedy is still under construction and what else is looked at after construction is complete. I can see the 3 of those making up the content of the FYR poster.

I can understand why you liked the second fact sheet as it is much more reader friendly. I'm not really sure why I didn't take to it the first time I read it but in part it might be that the simplified language sounded too staged (but that is really more of a reflection of where I am). The one concern I have is that it really focusses on areas where EPA has done the work, left to be a distant observer and is coming back to take a look. That's really not the case at EMF as much of the work is still under construction (and in design). I don't know if that would confuse people.

Also, it bugs me a bit with the references to the five years. I know this is a five-year review but really that's five years from a date that came after 15+ years of work at the Site, over 10 years after the ROD was signed and a couple years after Simplot began to seriously invest in lining the gypstack (the major piece under the Simplot IRODA). In addition, it was several years before any cleanup action was initiated at FMC. While we can make sense of that – I doubt it is clear to many and it's a divergent fact that could deter logical path thinkers from the more

important issues. (really it is 5 years after we signed the Simplot IRODA since it didn't get entered into CERCLIS at the time of the ROD).

Enough for now.

Interesting – it would be good to use the diagram as the basis for a poster and/or handouts regarding the FYR. On first glance I would have thought the shorter, second fact sheet was the better product. What don't you like about it?

Thanks for finding these ☺

Here's what we got from HQ. A number of the links don't seem to be current but here is one for a fact sheet that has a couple good graphics

<http://www.epa.gov/superfund/cleanup/postconstruction/fiveyearreviewfactsheet.pdf>

and a not so great fact sheet

http://www.epa.gov/superfund/community/today/pdfs/sf_5year.pdf

Hi Jannine!

Hope all is well with you. Good to hear that it seems like things are progressing with the FYR and I may see it early! ☺

Here are a couple things I came up with.

- -- Fact Sheet with some figure from the FYR webpage:
<http://www.epa.gov/superfund/cleanup/postconstruction/fiveyearreviewfactsheet.pdf>
- Attached Powerpoint file of one of the figures from the above fact sheet
- Podcast that Region 3 developed on FYRs that you can share: [R3 5YR podcast](#)
- Information from the CI toolkit on FYRs: <http://www.epa.gov/superfund/community/pdfs/toolkit/five-year-review.pdf>

Hope this helps!

Jen

We are planning a public open house for the Eastern Michaud Flats Superfund Site. We'll be setting up a number of posters and slide shows around the room and allow folks to come in, mingle and ask questions.

Since it is time for EMFs FYR, we thought it might be good to have a poster depicting what that is (or isn't). Are you aware of any PowerPoint slides or posters that have been prepared for trainings or other uses that we might be able to borrow from?

I'm hoping you might have seen something that would save us a few hours of prep time.

BTW – Skeo will be preparing the FYR. It will probably be ready for your review in May or June. The Tribal review might prove to be interesting.

Thank you. Hope all is well with you.
